

The programming language for scientists

Carsten Bauer @ University of Cologne, October 2019

How good are you at programming?

A CEFR-like approach to measure programming proficiency

Raphael 'kena' Poss

Programming skills self-assessment matrix

		A1 Basic User	A2 Basic User	B1 Intermediate User	B2 Intermediate User	C1 Proficient User	C2 Proficient User
Writing	Writing code	I can produce a correct implementation for a simple function, given a well-defined specification of desired behavior and interface, without help from others.	I can determine a suitable interface and produce a correct implementation, given a loose specification for a simple function, without help from others. I can break down a complex function specification in smaller functions.	I can estimate the space and time costs of my code during execution. I can empirically compare different implementations of the same function specification using well-defined metrics, including execution time and memory footprint. I express invariants in my code using preconditions, assertions and post-conditions. I use stubs to gain flexibility on implementation order.	I use typing and interfaces deliberately and productively to structure and plan ahead my coding activity. I can design and implement entire programs myself given well-defined specifications on external input and output. I systematically attempt to generalize functions to increase their reusability.	I can systematically recognize inconsistent or conflicting requirements in specifications. I can break down a complex program architecture in smaller components that can be implemented separately, including by other people. I can use existing (E)DSLs or metaprogramming patterns to increase my productivity.	I can reliably recognize when under-specification is intentional or not. I can exploit under-specification to increase my productivity in non-trivial ways. I can devise new (E)DSLs or create new metaprogramming patterns to increase my productivity and that of other programmers.
	Refactoring	I can adapt my code when I receive small changes in its specification without rewriting it entirely, provided I know the change is incremental. I can change my own code given detailed instructions from a more experienced programmer.	I can determine myself whether a small change in specification is incremental or requires a large refactoring. I can change my own code given loose instructions from a more experienced programmer.	I can derive a refactoring strategy on my own code, given relatively small changes in specifications. I can change other people's code given precise instructions from a person already familiar with the code.	I can predict accurately the effort needed to adapt my own code base to a new specification. I can follow an existing refactoring strategy on someone else's code. I can take full responsibility for the integration of someone else's patch onto my own code.	I can reverse-engineer someone else's code base with help from the original specification, and predict accurately the effort needed to adapt it to a new specification.	I can reverse-engineer someone else's code base without original specification, and predict accurately the effort needed to adapt it to a new specification.

There's a plethora of programming languages

Fortran

There's a plethora of programming languages

Fortran

MATLAB

There's a plethora of programming languages

Fast

Slow(ish)

MATLAB

Fortran

There's a plethora of programming languages

Static

Fortran

MATLAB

The two-language problem

- For **convenience**, use a scripting language
- but do all the **hard stuff** in a “systems language”
- Shows up as **black box packages** in scripting languages
- Creates a **social barrier** – a wall between users and developers

 numpy / numpy

The **julia** unification

The **julia** unification

Simple syntax +
grammar

Fast answers

Interactivity

```
function babylonian( $\alpha$ ; N = 10)
    @assert  $\alpha$  > 0 " $\alpha$  must be > 0"
    t = (1+ $\alpha$ )/2
    for i = 2:N
        t = (t +  $\alpha$ /t)/2
    end
    t
end
```

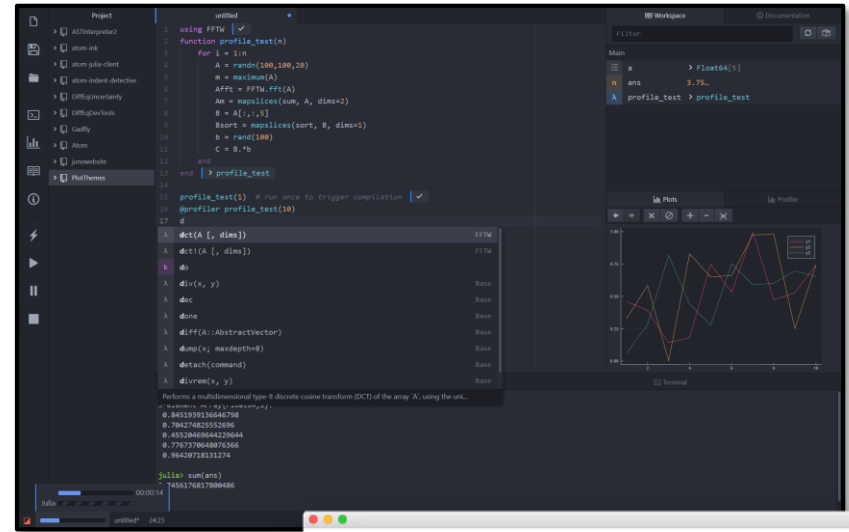

`babylonian(π)` $\approx \sqrt{\pi}$

The **julia** unification

Simple syntax +
grammar

Fast answers

Interactivity

The screenshot shows the Julia REPL interface. The main window displays a function definition for `profile_test` and its execution. The function iterates over a range of values, calculating the sum of squares of random numbers. The output shows the function being called and the result being displayed.

The **julia** unification

Simple syntax +
grammar

Fast answers

Interactivity

```
julia> function sumup()
```

```
    x = 0
```

```
    for i in 1:100
```

```
        x += i
```

```
    end
```

```
    x
```

```
end
```

```
sumup (generic function with 2 methods)
```

```
julia> @code_llvm debuginfo=:none sumup()
```

```
; Function Attrs: uwtable
```

```
define i64 @julia_sumup_12626() #0 {
```

```
top:
```

```
    ret i64 5050
```

```
}
```

Just returns the answer!
(The for loop was compiled away)

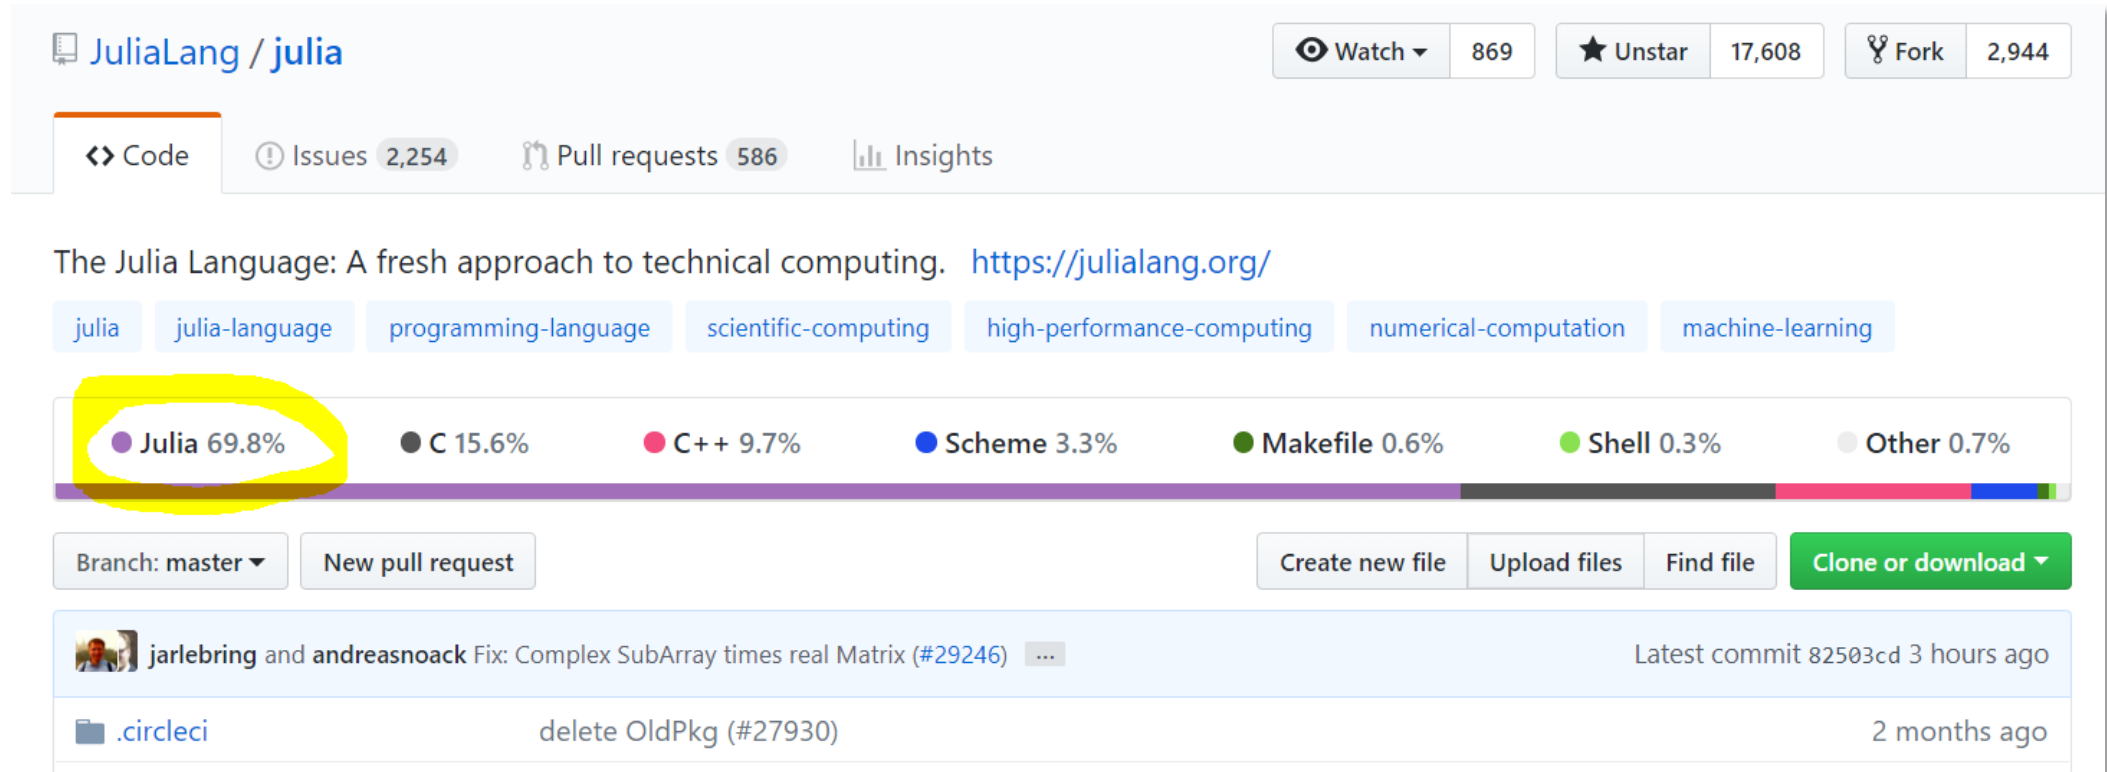

It is expressive

It is fast

It is free and open source

The screenshot shows the GitHub repository for JuliaLang. The repository name is "JuliaLang / julia". It has 869 watchers, 17,608 stars, and 2,944 forks. The repository is categorized as "Code", "Issues" (2,254), "Pull requests" (586), and "Insights".

The description of the repository is: "The Julia Language: A fresh approach to technical computing. <https://julialang.org/>".

The repository is tagged with several topics: `julia`, `julia-language`, `programming-language`, `scientific-computing`, `high-performance-computing`, `numerical-computation`, and `machine-learning`.

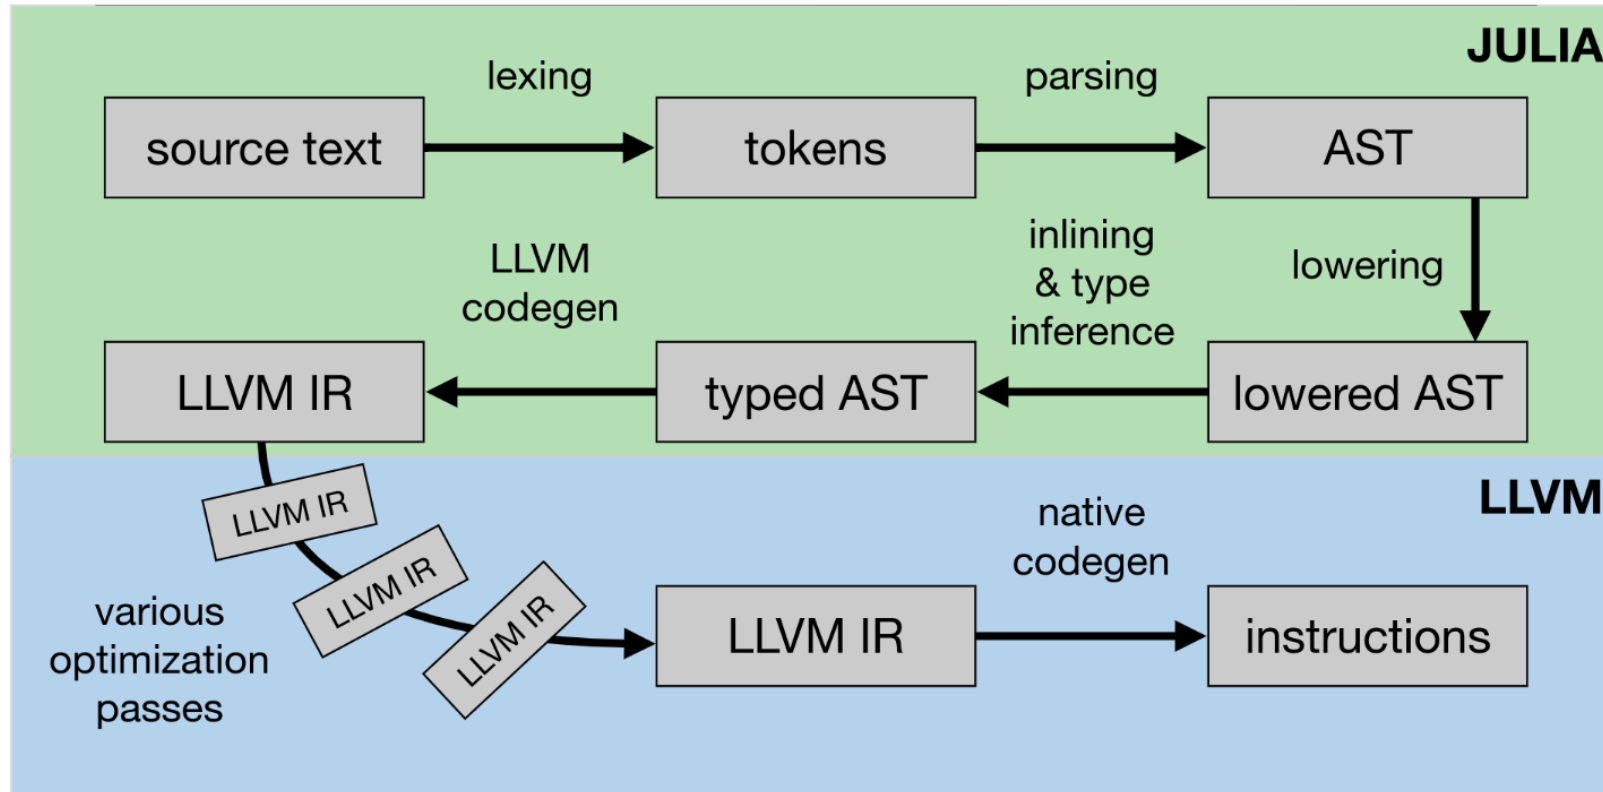

A horizontal bar chart shows the distribution of languages used in the repository. The data is as follows:

Language	Percentage
Julia	69.8%
C	15.6%
C++	9.7%
Scheme	3.3%
Makefile	0.6%
Shell	0.3%
Other	0.7%

The "Julia 69.8%" label is highlighted with a yellow circle. Below the chart, there are buttons for "Branch: master", "New pull request", "Create new file", "Upload files", "Find file", and "Clone or download".

The commit history shows the latest commit by jarlebring and andreasnoack: "Fix: Complex SubArray times real Matrix (#29246)" 3 hours ago. Another commit by .circleci: "delete OldPkg (#27930)" 2 months ago is also visible.
